Modeling to Inform Infectious Disease Control

2015-04-28 the vector borne zika virus joins
avian influenza ebola and yellow fever as recent

public health crises threatening pandemicity by a combination of stochastic modeling and economic geography this book proposes two key causes together explain the explosive spread of the worst of the vector borne outbreaks ecosystems in which such pathogens are largely controlled by environmental stochasticity are being drastically streamlined by both agribusiness led deforestation and deficits in public health and environmental sanitation consequently a subset of infections that once burned out relatively quickly in local forests are now propagating across susceptible human populations whose vulnerability to infection is often exacerbated in structurally adjusted cities the resulting outbreaks are characterized by greater global extent duration and momentum as infectious diseases in an age of nation states and global health programs cannot as much of the present modeling literature presumes be described by interacting populations of host vector and pathogen alone a series of control theory models is also introduced here these models useful to researchers and health officials alike explicitly address interactions between government ministries and the pathogens they aim to control

Centers for Disease Control and Prevention 2015
this book attempts to set communicable diseases and the efforts to control them in a social and historical context the primary focus is on england with its particular history culture and traditions the timescale covered is extensive and ambitious and the many strands that came together in the nineteenth century to form the english public health service are clearly highlighted however the main emphasis of the narrative is on developments from the second world war onwards in some of which the author has had a degree of personal involvement as a schoolchild medical student hospital doctor army doctor and public health physician the work as a whole reveals the persisting nature of communicable diseases throughout history and strongly argues that although the relevant importance of individual infections may vary over time man's struggle against the microbiological world can never be relaxed how england has been affected is described in detail and evidence is put forward to suggest that complacency or at least misjudgement concerning the ever present risks of emerging and re emerging infections led unwisely to the dismantling in 1974 of its established

arrangements for their control along with the subsequent need frequently repeated to create new structures for this purpose this book will appeal strongly to all students and practitioners of public health along with those interested in english social history

The Control of Communicable Diseases 1940
infectious diseases are the leading cause of death globally particularly among children and young adults the spread of new pathogens and the threat of antimicrobial resistance pose particular challenges in combating these diseases major infectious diseases identifies feasible cost effective packages of interventions and strategies across delivery platforms to prevent and treat hiv aids other sexually transmitted infections tuberculosis malaria adult febrile illness viral hepatitis and neglected tropical diseases the volume emphasizes the need to effectively address emerging antimicrobial resistance strengthen health systems and increase access to care the attainable goals are to reduce incidence develop innovative approaches and optimize existing tools in resource constrained settings

Disease Control Priorities in Developing Countries 2006-04-02 based on careful analysis of burden of disease and the costs of interventions this second edition of disease control priorities in developing countries 2nd edition highlights achievable priorities measures progress toward providing efficient equitable care promotes cost effective interventions to targeted populations and encourages integrated efforts to optimize

health nearly 500 experts scientists epidemiologists health economists academicians and public health practitioners from around the world contributed to the data sources and methodologies and identified challenges and priorities resulting in this integrated comprehensive reference volume on the state of health in developing countries

Manual for the Surveillance of Vaccine-Preventable Diseases, 2013 2013-11 when an outbreak of an infectious disease is suspected a local health agency may notify a state or federal agency and request additional resources to investigate and if necessary contain it however due to capacity constraints state and federal health agencies may not be able to grant all such requests which may give an incentive to local agencies to request help strategically we study a model of detection and control of an infectious disease by local health agencies in the presence of imperfect information about the likelihood of an outbreak and limited diagnostic capacity when diagnostic capacity is rationed based on reports of symptoms the decision to report symptoms or not creates a trade off on the one hand rigorous testing allows one to make an informed disease control decision on the other hand it also increases the probability that the disease will spread from an untested area where fewer precautionary measures are taken symptoms are overreported respectively reported truthfully or underreported when the cost of disease control is

sufficiently small respectively in some intermediate range or sufficiently large if the disease incidence decreases or infectiousness increases symptoms are reported less frequently if the precision of private signals increases the extent of overreporting of symptoms may increase for different values of the parameters it can be socially optimal to subsidize or tax requests for additional investigations and confirmatory testing

Disease Control Priorities, Third Edition (Volume 8) 2017-11-20 this report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke many surgeon general s reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies mechanisms of disease are important because they may provide plausibility which is one of the guideline criteria for assessing evidence on causation this report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke this evidence is relevant to understanding how smoking causes disease to identifying those who may be particularly susceptible and to assessing the potential risks of tobacco products
