is how to structure the firms environment so that it attains the speed and low cost of high volume flow lines while retaining the flexibility and customization potential of a low volume job shop the books three parts are organized according to three categories of skills required by managers and engineers basics intuition and synthesis part i reviews traditional operations management techniques and identifies the necessary components of the science of manufacturing part ii presents the core concepts of the book beginning with the structure of the science of manufacturing and a discussion of the systems approach to problem solving other topics include behavioral tendencies of manufacturing plants push and pull production systems the human element in operations management and the relationship between quality and operations chapter conclusions include main points and observations framed as manufacturing laws in part iii the lessons of part i and the laws of part ii are applied to address specific manufacturing management issues in detail the authors compare and contrast common problems including shop floor control long range aggregate planning workforce planning and capacity management a main focus in part iii is to help readers visualize how general concepts in part ii can be applied to specific problems written for both

engineering and management students the authors demonstrate the effectiveness of a rule based and data driven approach to operations planning and control they advance an organized framework from which to evaluate management practices and develop useful intuition about manufacturing systems drawing on their decades of teaching experience william briggs and lyle cochran have created a calculus text that carries the teacher s voice beyond the classroom that voice evident in the narrative the figures and the questions interspersed in the narrative is a master teacher leading readers to deeper
