digitat publishing presents to you this special edition of the foundations of science science and hypothesis the value of science science and method by henri poincaré digitat publishing considers every written word to be a legacy of humankind every digitat book has been carefully reproduced for republishing in a new modern format the books are

available in print as well as ebooks digicat hopes you will treat this work with the acknowledgment and passion it deserves as a classic of world literature in the last years it was observed an increasing interest of computer scientists in the structure of biological molecules and the way how they can be manipulated in vitro in order to define theoretical models of computation based on genetic engineering tools along the same lines a parallel interest is growing regarding the process of evolution of living organisms much of the current data for genomes are expressed in the form of maps which are now becoming available and permit

the study of the evolution of organisms at the scale of genome for the first time on the other hand there is an active trend nowadays throughout the field of computational biology toward abstracted hierarchical views of biological sequences which is very much in the spirit of computational linguistics in the last decades results and methods in the field of formal language theory that might be applied to the description of biological sequences were pointed out this book constitutes the refereed proceedings of the 14th international conference on database systems for advanced applications dasfaa 2009 held

in brisbane australia in april 2009 the 39 revised full papers and 22 revised short papers presented together with 3 invited keynote papers 9 demonstration papers 3 tutorial abstracts and one panel abstract were carefully reviewed and selected from 186 submissions the papers are organized in topical sections on uncertain data and ranking sensor networks graphs rfid and data streams skyline and rising stars parallel and distributed processing mining and analysis xml query privacy xml keyword search and ranking and services xml data processing and multimedia the refereed proceedings of the 7th international conference on

developments in language theory dlt 2003 held in szeged hungary in july 2003 the 27 revised full papers presented together with 7 invited papers were carefully reviewed and selected from 57 submissions all current aspects in language theory are addressed in particular grammars acceptors and transducers for strings trees graphs arrays etc algebraic theories for automata and languages combinatorial properties of words and languages formal power series decision problems efficient algorithms for automata and languages and relations to complexity theory and logic picture description and analysis dna computing

quantum computing cryptography and concurrency in the last two decades the development of specific methodologies for the control of systems described by nonlinear mathematical models has attracted an ever increasing interest new breakthroughs have occurred which have aided the design of nonlinear control systems however there are still limitations which must be understood some of which were addressed at the ifac symposium in capri the emphasis was on the methodological developments although a number of the papers were concerned with the presentation of applications

of nonlinear design philosophies to actual control problems in chemical electrical and mechanical engineering the university of genoa ohio state university joint conference on new trends in systems theory was held at the badia di s andrea in genoa on july 9 11 1990 this proceedings volume contains articles based on two of the three plenary talks and most of the shorter presentations the papers are arranged by author and no attempt has been made to organize them by topic we would like to thank the members of the scientific committee and of the program committee the speakers and authors and everyone who

attended the conference approximately 120 researchers and students from all over the world visited genoa for the meeting representing a wide spectrum of areas in pure and applied control and systems theory the success of the conference depended on their high level of scientific and engineering expertise not to mention their enthusiasm the conference on new trends in systems theory would not have been possible without the help of a great many institutions and people we would like to thank the university of genoa particularly professor enrico beltrametti and the ohio state university s columbian quincentenary committee led

by professor christian zacher for encouragement and financial assistance the university of genoa mathematics department and communication computer and system sciences department supplied assistance and technical help the staff of the consorzio genova ricerche particularly ms piera ponta and ms camilla marconi worked diligently over many months and especially during the conference itself to insure a smooth and enjoyable meeting this volume presents the proceedings of the second european conference on computational learning theory eurocolt 95 held in barcelona spain in march 1995 the book

contains full versions of the 28 papers accepted for presentation at the conference as well as three invited papers all relevant topics in fundamental studies of computational aspects of artificial and natural learning systems and machine learning are covered in particular artificial and biological neural networks genetic and evolutionary algorithms robotics pattern recognition inductive logic programming decision theory bayesian mdl estimation statistical physics and cryptography are addressed this book fills a gap by presenting our current knowledge and understanding of continuum based concepts

behind computational methods used for microstructure and process simulation of engineering materials above the atomic scale the volume provides an excellent overview on the different methods comparing the different methods in terms of their respective particular weaknesses and advantages this trains readers to identify appropriate approaches to the new challenges that emerge every day in this exciting domain divided into three main parts the first is a basic overview covering fundamental key methods in the field of continuum scale materials simulation the second one then goes on to look at applications

of these methods to the prediction of microstructures dealing with explicit simulation examples while the third part discusses example applications in the field of process simulation by presenting a spectrum of different computational approaches to materials the book aims to initiate the development of corresponding virtual laboratories in the industry in which these methods are exploited as such it addresses graduates and undergraduates lecturers materials scientists and engineers physicists biologists chemists mathematicians and mechanical engineers this book constitutes the refereed

proceedings of the 21st international conference on implementation and application of automata ctaa 2016 held in seoul south korea in july 2016 the 26 revised full papers presented were carefully reviewed and selected from 49 submissions the papers cover a wide range of topics including characterizations of automata computing distances between strings and languages implementations of automata and experiments enhanced regular expressions and complexity analysis includes the committee's technical reports no 1 1058 reprinted in v 1 37 this book constitutes the thoroughly refereed post proceedings of the 7th

international symposium on computer music modeling and retrieval cmmr 2010 held in Málaga Spain in June 2010 the 22 revised full papers presented were specially reviewed and revised for inclusion in this proceedings volume the book is divided in five main chapters which reflect the present challenges within the field of computer music modeling and retrieval the chapters range from music interaction composition tools and sound source separation to data mining and music libraries one chapter is also dedicated to perceptual and cognitive aspects that are currently subject to increased interest in the MIR community apart from

the names of Jan Baudouin de Courtenay 1845 1929 Mikołaj Kruszewski 1851 1887 and later Jerzy Kuryłowicz 1895 1978 Polish linguists and Polish linguistics generally have been little known in the West the first two were mentioned with approval by Saussure in an unpublished paper and this reference was picked up by Roman Jakobson and others many years later Kuryłowicz for his part made himself well known in the West through his important work as Indo-Europeanist even Semiticist and as a general linguist the present volume is a first attempt to broaden the perspectives on the Polish contribution to linguistics both

inside and outside of Poland during the past centuries specialists in their respective fields contributed chapters on the origins and development of general linguistics Z. Wąsik applied linguistics F. Grucza lexicology T. Piotrowski dialectology S. Gogolewski and onomastics S. Gala followed by five chapters presenting the theories of the arguably most remarkable Polish linguistic thinkers from Baudouin de Courtenay A. Adamska Sałaciak Kruszewski F. M. Berezin and Kuryłowicz W. Smoczyński to Mikołaj Rudnicki 1881 1978 and Ludwik Zabrocki 1907 1977 both written by J. Bańczerowski detailed individual bibliographies a full index of

names with life dates of polish linguists from the renaissance to the present day and a thorough index of subjects and terms make this volume an important reference tool for anyone wishing to acquaint himself with the rich heritage of polish linguistic thought published in 1903 this book was the first comprehensive treatise on the logical foundations of mathematics written in english it sets forth as far as possible without mathematical and logical symbolism the grounds in favour of the view that mathematics and logic are identical it proposes simply that what is commonly called mathematics are merely later

deductions from logical premises it provided the thesis for which principia mathematica provided the detailed proof and introduced the work of frege to a wider audience in addition to the new introduction by john slater this edition contains russell s introduction to the 1937 edition in which he defends his position against his formalist and intuitionist critics internationally renowned specialists present a comprehensive survey of the latest advances in this area the biosynthetic and structural relationships of these compounds are summarized and newly discovered alkaloids described discusses versatile

biomimetic procedures as well as the pharmacology and clinical applications of monoterpenoid indole alkaloids botanical names of all plants cited have been extensively referenced the gratifying response to counterexamples in analysis cea was followed when the book went out of print by expressions of dismay from those who were unable to acquire it the connection of the present volume with cea is clear although the sights here are set higher in the quarter century since the appearance of cea mathematical education has taken some large steps reflected in both the undergraduate and graduate curricula what was once taken

as very new remote or arcane is now a well established part of mathematical study and discourse consequently the approach here is designed to match the observed progress the contents are intended to provide graduate and advanced undergraduate students as well as the general mathematical public with a modern treatment of some theorems and examples that constitute a rounding out and elaboration of the standard parts of algebra analysis geometry logic probability set theory and topology the items included are presented in the spirit of a conversation among mathematicians who know the language but are interested in

some of the ramifications of the subjects with which they routinely deal although such an approach might be construed as demanding there is an extensive glossary/index where all but the most familiar notions are clearly defined and explained the object of the body of the text is more to enhance what the reader already knows than to review definitions and notations that have become part of every mathematician's working context comprehensive and self contained exposition of singularities of plane curves including new previously unpublished results this two volume set lncs 8644 and lncs 8645 constitutes the refereed

proceedings of the 25th international conference on database and expert systems applications dexa 2014 held in munich germany september 1-4 2014 the 37 revised full papers presented together with 46 short papers and 2 keynote talks were carefully reviewed and selected from 159 submissions the papers discuss a range of topics including data quality social web xml keyword search skyline queries graph algorithms information retrieval xml security semantic web classification and clustering queries social computing similarity search ranking data mining big data approximations privacy data exchange data integration web

semantics repositories partitioning and business applications this book constitutes the refereed proceedings of the 11th international conference on foundations of software science and computational structures fossacs 2008 held in budapest hungary in march april 2008 as part of etaps 2008 the european joint conferences on theory and practice of software the 33 revised full papers presented together with the abstract of 1 invited talk were carefully reviewed and selected from 124 submissions a broad variety of theories and methods to support analysis synthesis transformation and verification of programs and software

systems are addressed including the following topics algebraic models automata and language theory behavioural equivalences categorical models computation processes over discrete and continuous data infinite state systems computational structures logics of programs modal spatial and temporal logics models of concurrent reactive distributed and mobile systems process algebras and calculi semantics of programming languages software specification and refinement type systems and type theory fundamentals of security semi structured data program correctness and verification this book presents numerical and other

approximation techniques for solving various types of mathematical problems that cannot be solved analytically in addition to well known methods it contains some non standard approximation techniques that are now formally collected as well as original methods developed by the author that do not appear in the literature this book contains an extensive treatment of approximate solutions to various types of integral equations a topic that is not often discussed in detail there are detailed analyses of ordinary and partial differential equations and descriptions of methods for estimating the values of integrals that are presented in a level of detail

that will suggest techniques that will be useful for developing methods for approximating solutions to problems outside of this text the book is intended for researchers who must approximate solutions to problems that cannot be solved analytically it is also appropriate for students taking courses in numerical approximation techniques
