refrigeration engineering is an interdisciplinary science based on physics thermodynamics fluid mechanics strength of materials and automation as well as on the applied sciences of compressors heat exchangers expanders pumps and others the objective of this book is to explain the various current modern refrigeration systems and their elements comprehensively as well as to improve and develop their estimation methods and design procedures the volume will be of interest to researchers engineers and technicians it may also be used as a reference book for lecturers and as a textbook for students of heat and process engineering food processing and air conditioning monthly references from world literature of books about 1000 journals and patents from 18 selected countries classified arrangement according to 18 sections such as milk and dairy products eggs and egg products and food microbiology

author subject indexes this book introduces two of the most exciting heat pumping technologies the coabsorbent and the thermal recovery mechanical vapor compression characterized by a high potential in primary energy savings and environmental protection new cycles with potential applications of nontruncated truncated hybrid truncated and multi effect coabsorbent types are introduced in this work thermal to work recovery compression twrc is the first of two particular methods explored here including how superheat is converted into work which diminishes the compressor work input in the second method thermal to thermal recovery compression ttrc the superheat is converted into useful cooling and or heating and added to the cycle output effect via the coabsorbent technology these and other methods of discharge gas superheat recovery are analyzed for single two three and multi stage compression cooling and heating ammonia and ammonia water cycles and the effectiveness results are given the author presents absorption related topics including the divided device method for mass and heat transfer analysis and truncation as a unique method for a better source task match along with advanced gas

recovery the first and second principles of cop and exergy calculation the ideal point approaching i p a effect and the two point theory of mass and heat transfer the book also addresses the new wording of the laplace equation the marangoni effect true explanation and the new mass and heat exchangers based on this effect the work goes on to explore coabsorbent separate and combined cooling heating and power chp production and advanced water lithium bromide cycle air conditioning as well as analyzing high efficiency ammonia water heat driven heating and industrial low temperature cooling in detail readers will learn how coabsorbent technology is based on classic absorption but is more general it is capable of offering effective solutions for all cooling and heating applications industry agriculture district household etc provided that two supplying heat sink sources with temperatures outdistanced by a minimum of 12 15oc are available this book has clear and concise presentation and illustrates the theory and applications with diagrams tables and flowcharts volumes 1 2 guide to the major companies of europe 1991 92 volume 1 arrangement of the book contains useful information on over 4000 of the top companies in the european community excluding the uk over 1100 this book has been arranged in order to allow the reader to companies of which are covered in volume 2 volume 3 covers find any entry rapidly and accurately over 1300 of the
