**Managerial Economics** 2002-01-29 data management systems enable various influential applications from high performance online services e.g. social networks like Twitter and Facebook or financial markets to big data analytics e.g. scientific exploration sensor networks business intelligence as a result data management systems have been one of the main drivers for innovations in the database and computer architecture communities for several decades recent hardware trends require software to take advantage of the abundant parallelism existing in modern and future hardware the traditional design of the data management systems however faces inherent scalability problems due to its tightly coupled components in addition it cannot exploit the full capability of the aggressive micro architectural features of modern processors as a result

today's most commonly used server types remain largely underutilized leading to a huge waste of hardware resources and energy in this book we shed light on the challenges present while running dbms on modern multicore hardware we divide the material into two dimensions of scalability implicit vertical and explicit horizontal the first part of the book focuses on the vertical dimension it describes the instruction and data level parallelism opportunities in a core coming from the hardware and software side in addition it examines the sources of under utilization in a modern processor and presents insights and hardware software techniques to better exploit the microarchitectural resources of a processor by improving cache locality at the right level of the memory hierarchy the second part focuses on the horizontal dimension i.e scalability bottlenecks of database applications at the level of multicore and multsocket multicore architectures it first presents a systematic way of eliminating such bottlenecks in online transaction processing workloads which is based on minimizing unbounded communication and shows several techniques that minimize bottlenecks in major components of database management systems then it demonstrates the data and work sharing opportunities for analytical workloads and reviews advanced scheduling mechanisms that are aware of nonuniform memory accesses and alleviate bandwidth saturation
