the aim of this monograph is to give a thorough and self contained account of functions of generalized bounded variation the methods connected with their study their relations to other important function classes and their applications to various problems arising in fourier analysis and nonlinear analysis in the first part the basic facts about spaces of functions of bounded variation and related spaces are collected the main ideas which are useful in studying their properties are presented and a comparison of their importance and suitability for applications is provided with a particular emphasis on illustrative examples and counterexamples the second part is concerned with sometimes quite surprising properties of nonlinear composition and superposition operators in such spaces moreover relations with riemann stieltjes integrals convergence tests for fourier series and applications to nonlinear integral equations are discussed the only prerequisite for understanding this book is a modest background in real analysis functional analysis and operator theory it is addressed to non specialists who want to get an idea of the development of the theory and its applications in the last decades as well as a glimpse of the diversity of the directions in which current research is moving since the authors try to take into account recent results and state several open problems this book might also be a fruitful source of
