*Advances in Engine Tribology* 2003 this book presents a solutions based approach to reducing and removing co2 from the atmosphere transforming it into solid crystalline caco3 through the ability of marine organisms such as molluscs crustacea corals and coccolithophore algae the overwhelming advantage of this approach is that it promises enhanced climate mitigation in comparison to planting forests industrial engineering carbon capture and storage process it also provides a sustainable food resource furthermore it would improve the ocean s biodiversity at the same time as the excess atmospheric co2 released by our use of fossil fuels is returned to the place it belongs as a present day fossil safely out of the atmosphere to the distant future if the level of finance and global effort that are readily foreseen for forest management and flue gas treatments were applied to expansion of global shellfish cultivation curative amounts of carbon dioxide could be permanently removed from the atmosphere within a few decades the concept presented in this book could have a profound influence on the life of the planet
