construction and facility use the fifth edition expands the scope of the manual to meet the requirements of all participants involved in a construction project in a stage by stage progression including owners, architects, design-builders, contractors, construction managers, product representatives, financial institutions, regulatory authorities, attorneys, and facility managers. It promotes a team model for successful implementation. This series of reference books describes sciences of different eras in and around geodesy with independent chapters. Each chapter covers an individual era and describes the history, theory, objective, technology, development, highlights of research, and applications. In addition, problems as well as future directions are discussed. The subjects of this reference book include absolute and relative gravimetry, adaptively robust Kalman filters with applications in navigation, airborne gravity field determination, analytic orbit theory, deformation and tectonics, earth rotation, equivalence of GPS algorithms and its inference, marine geodesy, satellite laser ranging, superconducting gravimetry, and synthetic aperture radar interferometry. These are individual subjects in and around geodesy and are for the first time combined in a unique book which may be used for teaching or for learning basic principles of many subjects related to geodesy. The material is suitable to provide a general overview of geodetic sciences for high-level geodetic researchers, educators, as well as engineers and students. Some of the chapters are written to fill literature blanks of the related areas. Most chapters are written by well-known scientists throughout the world in the related areas. The chapters are ordered by their titles. Summaries of the individual chapters and introductions of their authors and co-authors are as follows:

Chapter 1: Absolute and relative gravimetry provides an overview of the gravimetric methods to determine most accurately the gravity acceleration at given locations.
