I'd rather have one or two of his whiplashing essays in my hands than almost any tome of philosophy. Thomas Moore's "The Confirmed Case of Mad Cow Disease (BSE) in June 2005" illustrates the economic impact of disease outbreaks as additional countries closed their markets to U.S. beef and beef products. Emerging diseases also threaten public health: 11 out of 12 of the major global disease outbreaks over the last decade were from zoonotic agents that spread from animals to humans. Animal Health at the Crossroads: Preventing, Detecting, and Diagnosing Animal Diseases finds that in general the U.S. animal health framework has been slow to take advantage of state-of-the-art technologies being used now to protect public health. Better diagnostic tests for identifying all animal diseases should be made a priority. The report also recommends that the nation establish a high-level authoritative and accountable coordinating mechanism to engage and enhance partnerships among local, state, and federal agencies and the private sector. Early detection is essential to the control of emerging, reemerging, and novel infectious diseases, whether naturally occurring or intentionally introduced. Containing the spread of such diseases in a

profoundly interconnected world requires active vigilance for signs of an outbreak rapid recognition of its presence and diagnosis of its microbial cause in addition to strategies and resources for an appropriate and efficient response although these actions are often viewed in terms of human public health they also challenge the plant and animal health communities surveillance defined as the continual scrutiny of all aspects of occurrence and spread of a disease that are pertinent to effective control involves the systematic collection analysis interpretation and dissemination of health data disease detection and diagnosis is the act of discovering a novel emerging or reemerging disease or disease event and identifying its cause diagnosis is the cornerstone of effective disease control and prevention efforts including surveillance disease surveillance and detection relies heavily on the astute individual the clinician veterinarian plant pathologist farmer livestock manager or agricultural extension agent who notices something unusual atypical or suspicious and brings this discovery in a timely way to the attention of an appropriate representative of human public health veterinary medicine or agriculture most developed countries have the ability to detect
