working on the premise that even the best method can be made better by optimizing its individual components attachment of dissimilar materials in engineering and surgical practice is a perennial challenge bimaterial attachment sites are common locations for injury repeated injury and mechanical failure nature presents several highly effective solutions to the challenge of bimaterial attachment that differ from those found in engineering practice structural interfaces and attachments in biology describes the attachment of dissimilar materials from multiple perspectives the text will simultaneously elucidate natural bimaterial attachments and outline engineering principles underlying successful attachments to the communities of tissue engineers and surgeons included an in depth analysis of the biology of attachments in the body and mechanisms by which robust attachments are formed a review of current concepts of attaching

dissimilar materials in surgical practice and a discussion of bioengineering approaches that are currently being developed environmental stresses and metabolic by products can severely affect the integrity of genetic information by inducing dna damage and impairing genome stability as a consequence plant growth and productivity are irreversibly compromised to overcome genotoxic injury plants have evolved complex strategies relying on a highly efficient repair machinery that responds to sophisticated damage perception signaling networks the dna damage signaling network contains several key components dna damage sensors signal transducers mediators and effectors most of these components are common to other eukaryotes but some features are unique to the plant kingdom atm and atr are well conserved members of pkk family which amplify and transduce signals to downstream effectors atm primarily responds to dna

double strand breaks while *atr* responds to various forms of dna damage the signals from the activated transducer kinases are transmitted to the downstream cell cycle regulators such as *chk1* *chk2* and *p53* in many eukaryotes however plants have no homologue of *chk1* *chk2* nor *p53* the finding of arabidopsis transcription factor *sog1* that seems functionally but not structurally similar to *p53* suggests that plants have developed unique cell cycle regulation mechanism the double strand break repair recombination repair postreplication repair and lesion bypass have been investigated in several plants the dna double strand break a most critical damage for organisms are repaired non homologous end joining *nhej* or homologous recombination *hr* pathway damage on template dna makes replication stall which is processed by translesion synthesis *tls* or error free postreplication repair *ppr* pathway deletion of the error prone *tls* polymerase

reduces mutation frequencies suggesting *ppr* maintains the stalled replication fork when *tls* is not available unveiling the regulation networks among these multiple pathways would be the next challenge to be completed some intriguing issues have been disclosed such as the cross talk between dna repair senescence and pathogen response and the involvement of non coding rnas in global genome stability several studies have highlighted the essential contribution of chromatin remodeling in dna repair dna damage sensing signaling and repair have been investigated in relation to environmental stresses seed quality issues mutation breeding in both model and crop plants and all these studies strengthen the idea that components of the plant response to genotoxic stress might represent tools to improve stress tolerance and field performance this focus issue gives researchers the opportunity to gather and interact by providing mini reviews commentaries opinions

regenerative neurology nevertheless in spite of striking advancement concerning the molecular and cellular mechanisms which allow and regulate the neurogenic process its exploitation in mammals for brain repair strategies remains unsolved in non mammalian vertebrates adult neurogenesis also contributes to brain repair regeneration in mammals neural stem cells do respond to pathological conditions in the so called reactive neurogenesis yet without substantial regenerative outcome why even in the presence of stem cells in the brain we lack an effective reparative outcome in terms of regenerative neurology and which factors hamper the attainment of this goal essentially what remains unanswered is the question whether and how physiological functions of adult neurogenesis in mammals can be exploited for brain repair purposes a maintenance repair manual for the diy mechanic this guide to the 2004 2011 dodge durango and dakota covers all the key
