**Indigenous Peoples of the British Dominions and the First World War** 2011-11-03 the importance of oil in the world economy cannot be overstated and methods for recovering oil will be the subject of much scientific and engineering research for many years to come even after the application of primary depletion and secondary recovery processes usually waterflooding much oil usually remains in a reservoir and indeed in some heterogeneous reservoir systems as much as 70 of the original oil may remain thus there is an enormous incentive for the development of improved or enhanced methods of oil recovery aimed at recovering some portion of this remainil g oil the techniques used range from improved secondary flooding methods including polymer and certain gas injection processes through to enhanced or tertiary methods such as chemical surfactant caustic foam gas miscible carbon dioxide gas reinjection and thermal steam soak and drive in situ combustion the distinction between the classification ofthe methods usually refers to the target oil that the process seeks to recover that is in improved recovery we are usually aiming to increase the oil sweep efficiency whereas in tertiary recovery we aim to mobilise and recover residual or

capillary trapped oil there are a few books and collections of articles which give general overviews of improved and enhanced oil recovery methods however for each recovery method there is such a wide range of interconnected issues concerning the chemistry physics and fluid mechanics of flow in porous media that rarely are these adequately reviewed
